

Copilot Studio and Azure AI Workshop

Lab 2: Copilot studio Topics and Actions

Hands-on Lab Step-by-Step Guide

April 2025

Lab Overview and Pre-requisites

Learning Objectives

This lab is designed to enhance the Sales Buddy agent created in LAB 1, by adding **Actions** and **Topics**.

In Microsoft Copilot Studio, **Topics** define how an agent handles conversations. Each topic represents a specific subject or task, guiding the agent's responses to user inputs to ensure interactions are relevant and coherent.

Actions are integral components that enable your agent to perform specific tasks in response to user inputs or events.

Topics guide the conversation while **Actions** perform tasks. Topics can include actions as part of their conversation flow.

In this Lab, you will be creating an Action and Topic to perform 2 separate tasks

Lab 2a. Create new leads using a connector Action

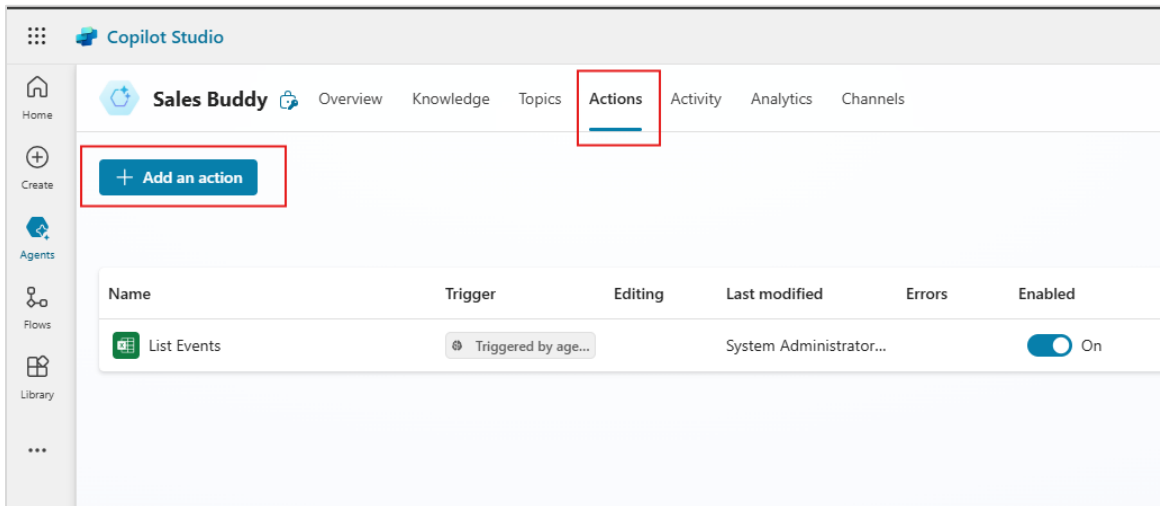

Lab 2b. Create new registration for customers/leads using a Topic + Action

Pre-requisites

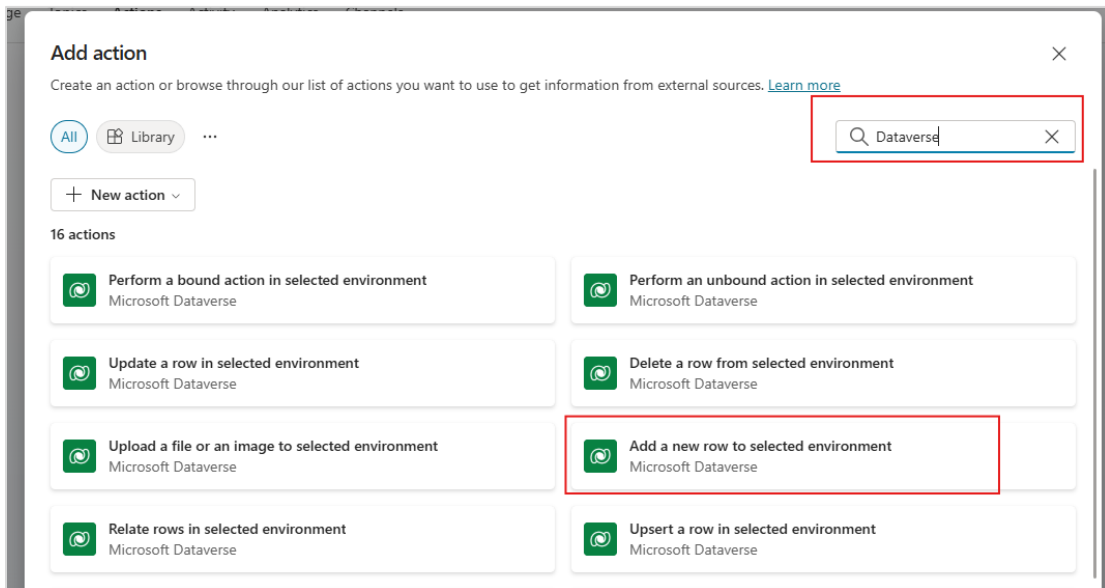

- You will need to have completed Lab 1 so you have the Sales Buddy agent created that we will be utilizing for this lab.

Lab 2a: Create new leads in CRM/Dataverse using a Connector Action

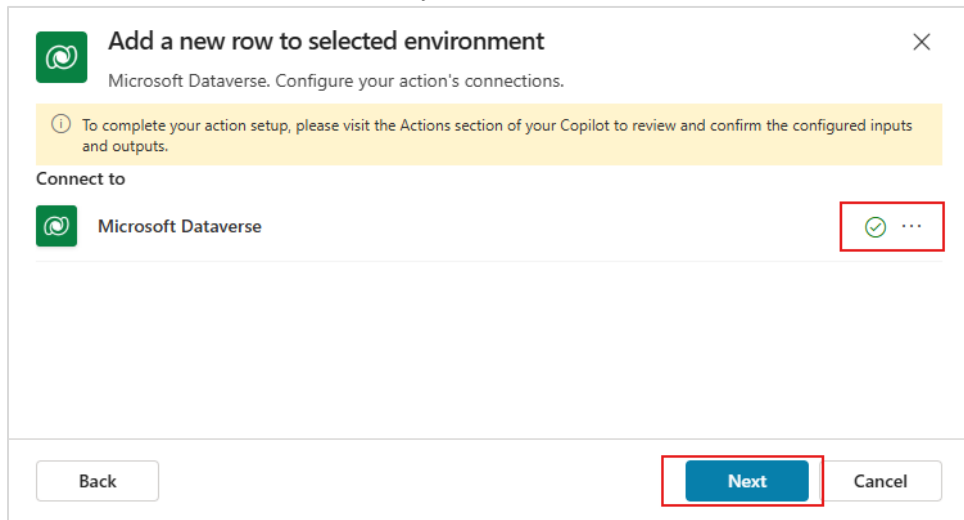

1. Open the Sales Buddy Agent created in Lab 1. Go to Actions Tab and click **+ Add an action**

2. Search for **Dataverse** connectors and select **Add a new row to selected environment**

3. Ensure the connection is already established and click **Next**

Add a new row to selected environment ×

Microsoft Dataverse. Configure your action's connections.

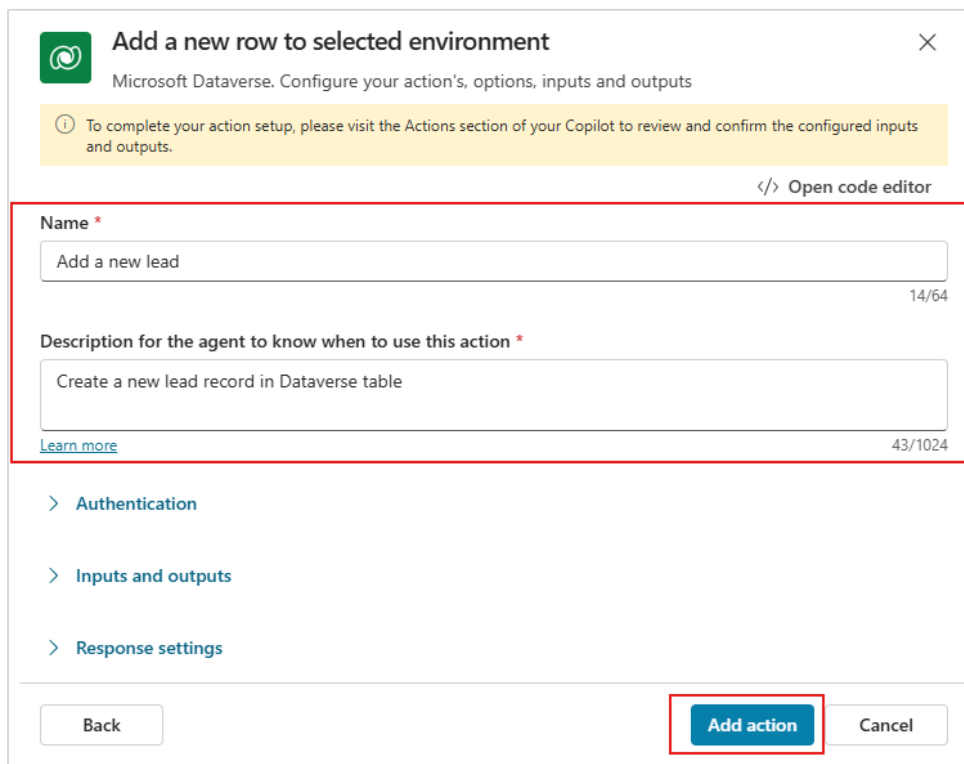

i To complete your action setup, please visit the Actions section of your Copilot to review and confirm the configured inputs and outputs.

Connect to

 Microsoft Dataverse ✓ ...

Back **Next** **Cancel**

4. Update the following
Name = Add a new lead,
Description = Create a new lead record in Dataverse table
and select **Add action**

Add a new row to selected environment ×

Microsoft Dataverse. Configure your action's, options, inputs and outputs

i To complete your action setup, please visit the Actions section of your Copilot to review and confirm the configured inputs and outputs.

Inputs and outputs

Response settings

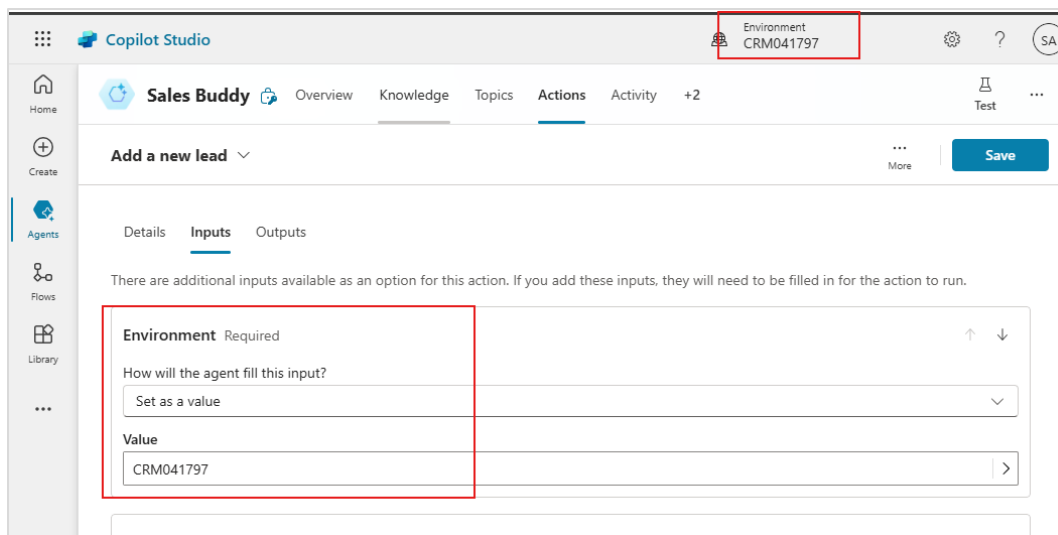

Back **Add action** **Cancel**

- You should find the newly added Action under the **Actions** tab. Open it again and update the **Action Name** = Add a new lead. Next click on **Inputs**:

The screenshot shows the 'Add a new lead' action configuration page in Copilot Studio. The 'Inputs' tab is selected. The 'Action name' field is highlighted with a red box and contains the text 'Add a new lead'. Below it, the 'Display name' field also contains 'Add a new lead'. The 'Description for the agent to know when to use this action' field contains 'Create a new lead record in Dataverse table'. There is a 'Learn more' link and a checkbox for 'Ask the user before running this action'.

- Under **Environment**, choose **Set as a value** and select your environment as **Value**

The screenshot shows the 'Add a new lead' action configuration page in Copilot Studio, specifically the 'Inputs' tab. The 'Environment' input is highlighted with a red box. It is labeled 'Environment Required'. Below the label, there is a dropdown menu for 'How will the agent fill this input?' with 'Set as a value' selected. Below that, there is a 'Value' field containing 'CRM041797'. In the top right corner, the current environment is displayed as 'Environment CRM041797'.

- Under **Table Name**, choose **Set as a value** and select the **Value** as **Leads**

Table Name Required
How will the agent fill this input?
Set as a value
Value
Leads

- You will find 2 more required inputs for mandatory fields in Leads table below. For these 2 inputs, we will not set any value by default, but we'll describe how Agent can receive these values from the user.

Under **Last Name**, update the **description** as – Ask for Lead's last name

Last Name Required
How will the agent fill this input?
Dynamically fill with best option (default)
Display name
Last Name
Identify as
User's entire response
Description
Ask for Lead's last name

Similarly, under **Topic**, update the **description** as – Ask for Lead Topic

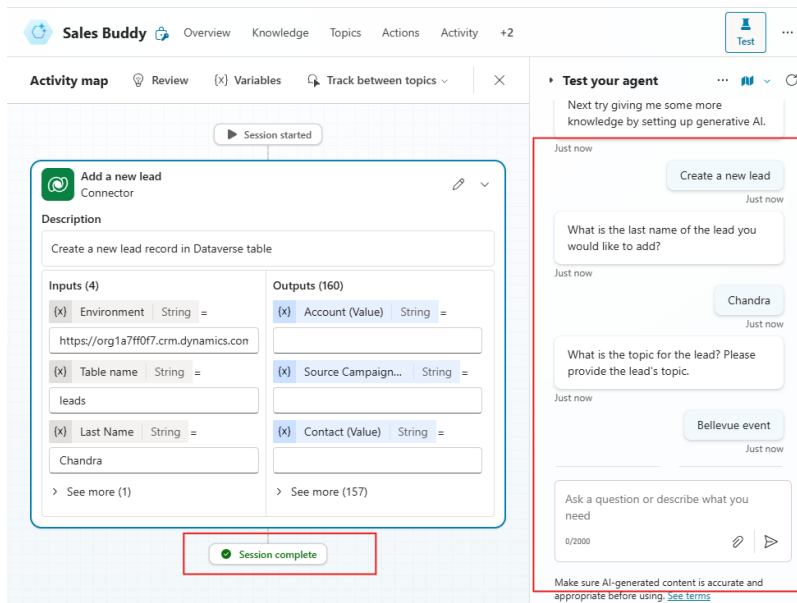

Topic Required
How will the agent fill this input?
Dynamically fill with best option (default)
Display name
Topic
Identify as
User's entire response
Description
Ask for Lead Topic

9. Click on **Save** to save the Action.
10. Now that our Action is configured with the required inputs, let's test this out. Open the **Test** window and send the following message:
 - **Create a new lead**

You can find that Agent requests for missing information (Last Name and Topic) from the end user

11. Respond to the Agent query by providing the last name and Topic. Once it is complete, the new Lead record will be created in the Dataverse table.

12. (Optional) You might need to create a connection for the first time. Click on Connect to follow the steps. Use the credentials from your demo tenant.

Lab 2b: Create New Event Registration using Topic

1. Go to the Topics Tab to **add a topic From Blank**.

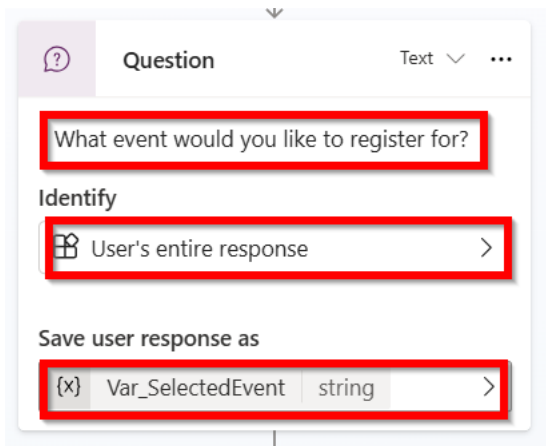

2. **Rename** the topic to "Event Registration"

3. Enter trigger description "Event Registration; Register for an event"

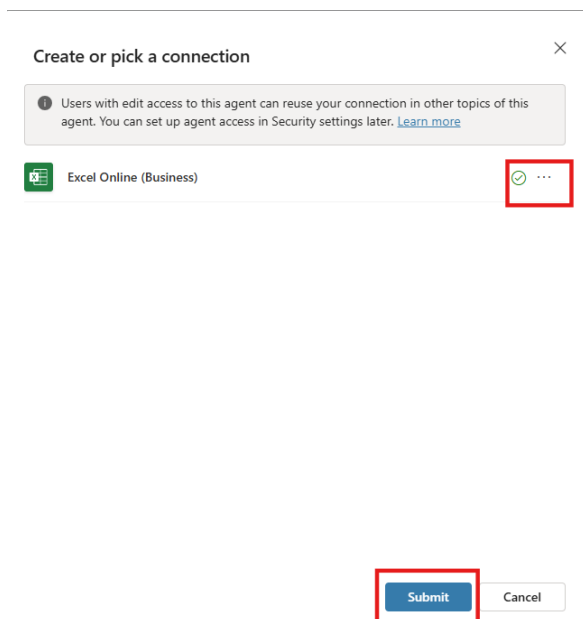

4. Add a node to **ask a question**. In the text field, enter "Which event would you like to register for?". In the Identify field, pick "User's entire response". In the Save user response as field, create a new variable renamed to Var_SelectedEvent.

5. Add an action, go to **Connector (preview)** tab, and search for "list rows present in a table" connector.

6. Create or pick a connection. Confirm you have the correct connection and click **Submit**.

7. Fill out the input parameters. **Location** field is the SharePoint site root url in the format of <https://yourenvironmentname.sharepoint.com/sites/SalesTeam/>. **Document Library** field is Documents. **File** name field is contoso_customer_events.xlsx. **Table** field is Table1.

Connector action

Inputs (4)

- * {x} Location (String) =
- * {x} Document Library (String) =
- * {x} File (String) =
- * {x} Table (String) =

8. Fill out advanced settings **Filter Query** field. Enter the formula as "EventName eq '' & Topic.Var_SelectedEvent & ''" then click **Insert**.

Advanced inputs (6)

- {x} Filter Query (String) =
- {x} Order By (String) =
- {x} Top Count (Number) =
- {x} Skip Count (Number) =

Enter formula

Custom System Environment **Formula**

fx "EventName eq '' & Topic.
Var_SelectedEvent & ''" ⓘ

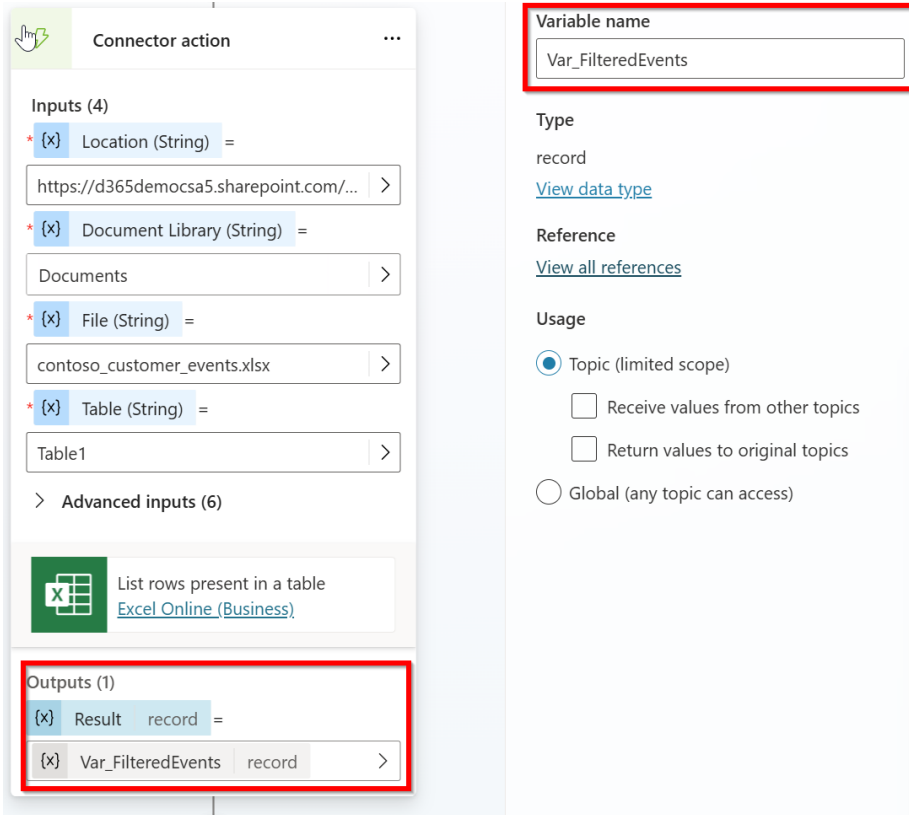

Press CTRL + M to disable / enable Tab character

Type

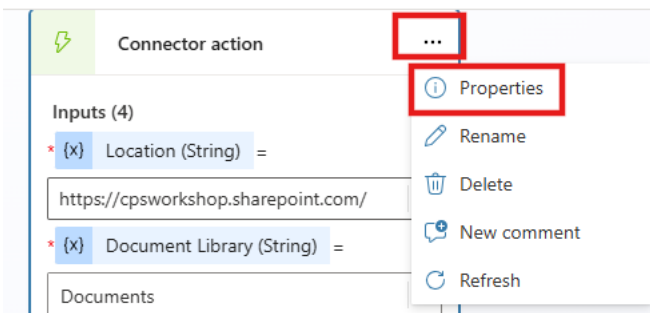

Output ☒ "EventName eq '' & Topic.

Insert **Cancel**

9. Rename the output parameter GetItems to "Var_FilteredEvents"

10. Add a latency message. Best practice when calling an action that may take some time is to set a latency message so the users knows the agent is working in the background. In the Connector action, click the (...) and select **Properties**.

11. Scroll down to **Latency Message** and click the **Send a message** box. Add the following message - **Just a minute while I grab your event options**. Then close the Properties box.

Connection reference

admin@CPSWorkshop.onmicrosoft.com

Request timeout (milliseconds)

30000

Error handling
Determine what happens when an error occurs.

Raise an error

Latency Message
In text conversations this message will be sent once.
In voice conversations, this message will loop until the operation is complete.

☒ Send a message

Message Text

+ Add **B** *I* **≡** **≡** {x} f_x

Just a minute while I grab your event options.

12. Add a variable management node , pick set a variable value. In the Set variable dropdown, create a new variable named "Var_FilteredEventText". In the To value dropdown, pick the existing variable "Var_FilteredEvents.value" that is the table.

Outputs (1)

{x} Result record =

{x} Var_FilteredEvents record

Set variable value

Set variable

Select a variable

To value

Enter or select a value

Select a variable

Custom System

Search variables

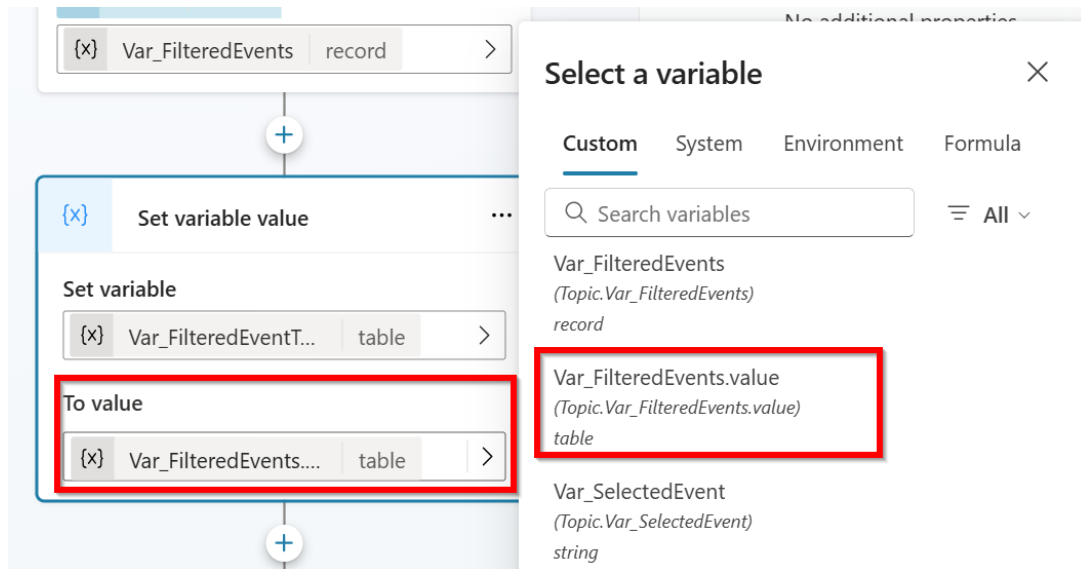

All

☒ Create a new variable

Var_FilteredEvents
(Topic.Var_FilteredEvents)
record

Var_FilteredEvents.value
(Topic.Var_FilteredEvents.value)
table

Var_SelectedEvent
(Topic.Var_SelectedEvent)
string

13. Change the variable `Var_FilteredEvents.value` type from `table` to `text` by using code editor. In the upper ribbon, click on **More** and select **Open Code editor**.

14. Scroll to the bottom of the code editor, change `kind` to `SetTextVariable`, change `value` to `"{Topic.Var_FilteredEvents.value}"`. **Save** and **close** the code editor

15. Add an action, pick New prompt (default AI model)

16. Name the prompt “**Extract event info**”. In the Prompt, enter the following and Save.

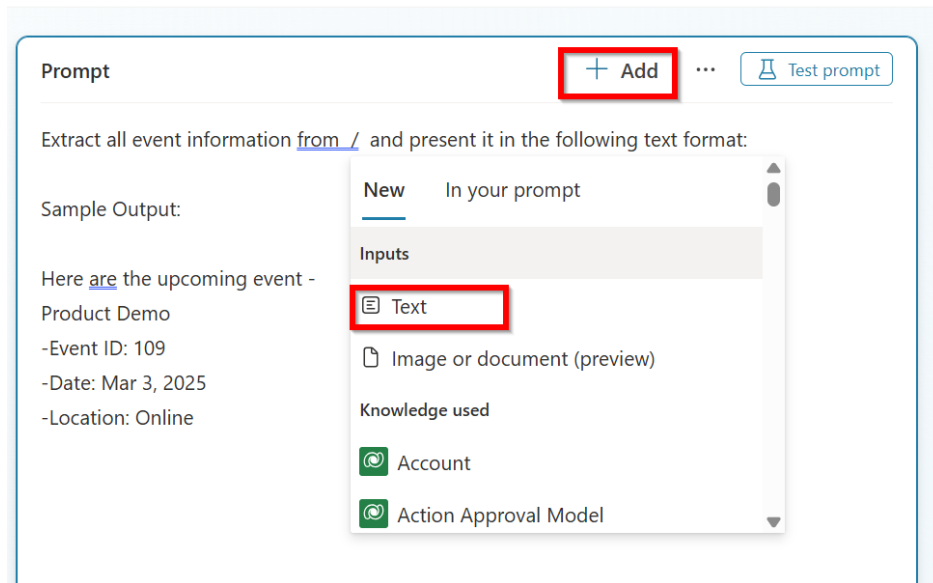

Extract all event information from  and present it in the following text format:

Sample Output:

*Here are the upcoming events –
Product Demo
-Event ID: 109
-Date: Mar 3, 2025
-Location: Online*

 is added by clicking on **+Add** button, pick **Text** under the **Inputs**. Enter the Name as “EventsJSON”

Extract event info

Prompt + Add ... Test prompt

Extract all event information from from / and present it in the following text format:

Sample Output:

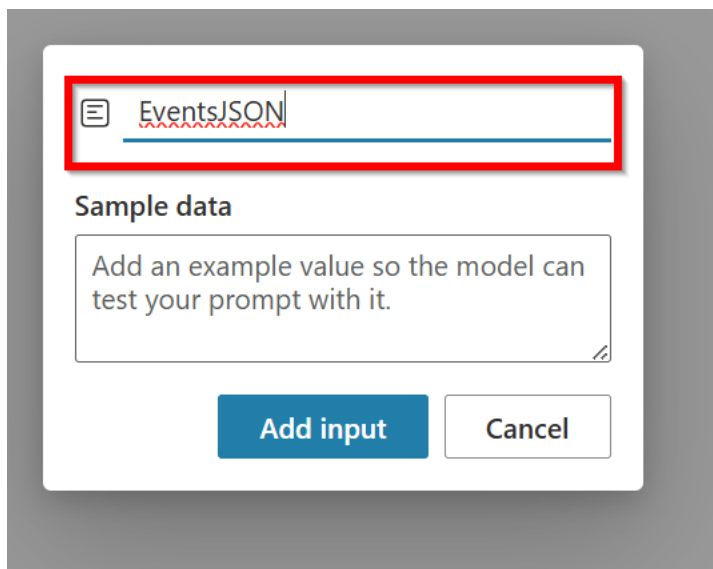

Here are the upcoming event -
Product Demo
-Event ID: 109
-Date: Mar 3, 2025
-Location: Online

Inputs

- ☒ Text
- ☐ Image or document (preview)

Knowledge used

- ☒ Account
- ☒ Action Approval Model

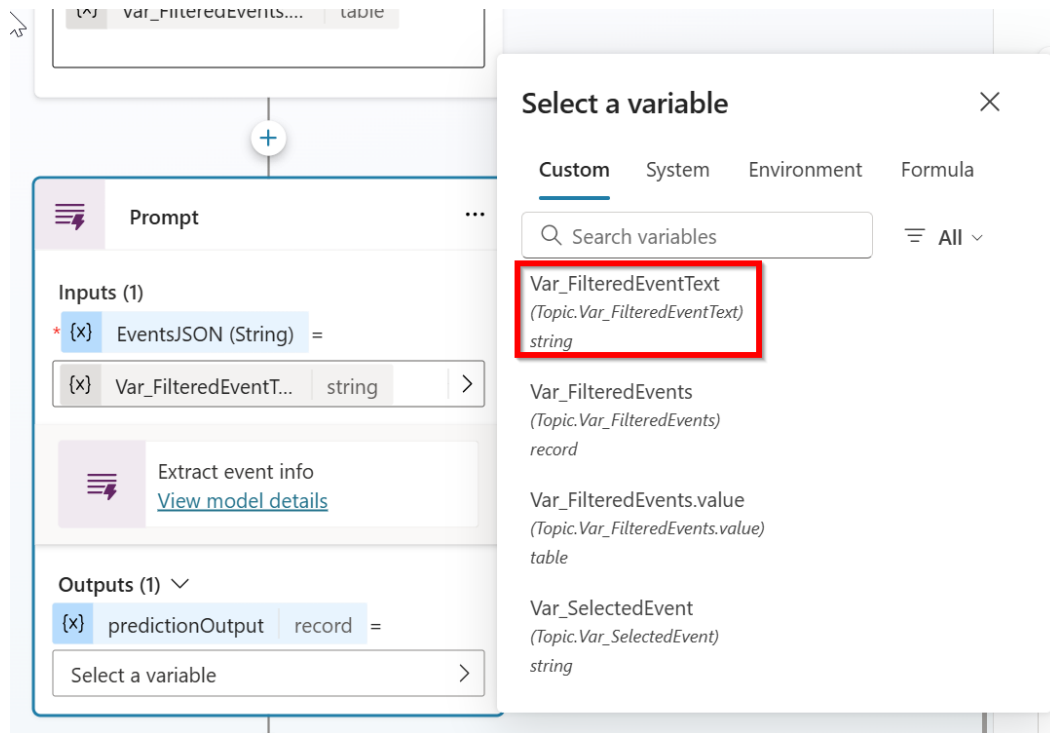

☒ EventsJSON

Sample data

Add an example value so the model can test your prompt with it.

Add input **Cancel**

17. Fill out the **input parameter** EventsJSON to be variable Var_FilteredEventText

18. Create a new variable for **Output parameter**, named Var_UpcomingEvents.

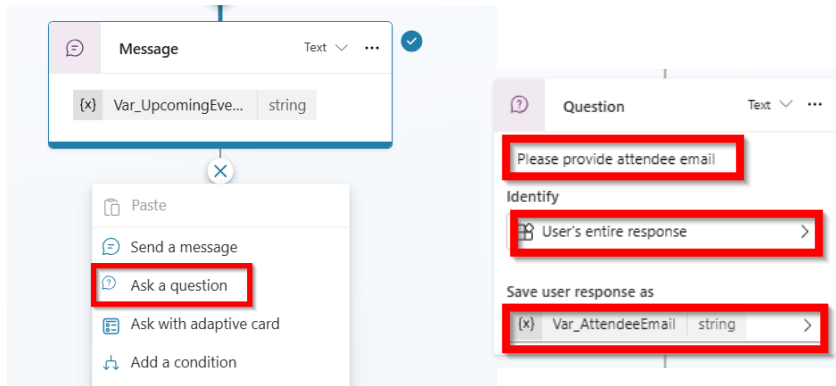

19. Add a **new node to send a message**. Pick Var_upcomingevents.text from the variable list.

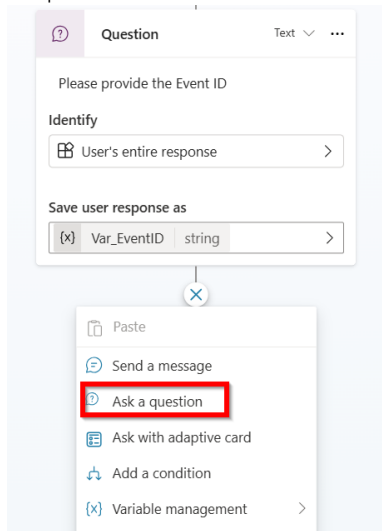

20. Save the agent and test it. You should see the conversation flow as following:

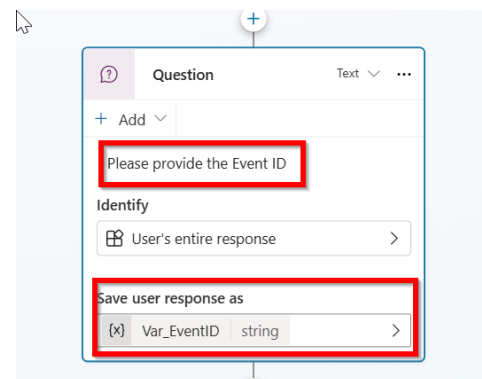

21. **Add a question node** to capture EventID. In the text field, enter "Please provide the Event ID". In the Identify field, pick User's entire response. In the Save user response as field, rename the variable to "Var_EventID".

22. **Add a new node** to capture attendee email. In the text field, enter "Please provide attendee email". In the Identify field, pick User's entire response. In the Save user response as field, rename the variable to Var_AttendeeEmail

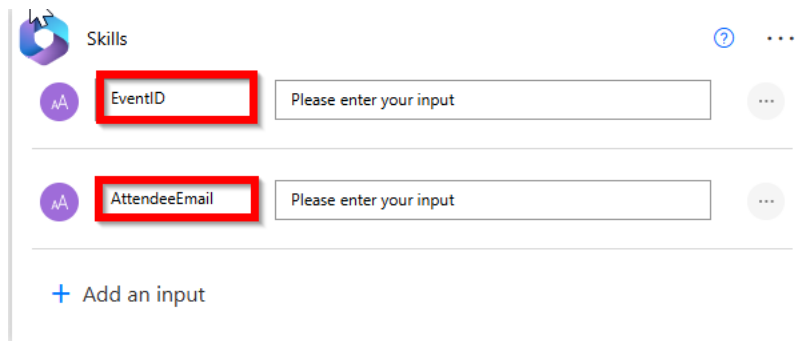

23. Now, we need to create a **power automate flow** to log attendee email and event id registration to the Excel sheet.
 - a. **Add an action node** and pick New **Power Automate flow** in the Basic actions tab.

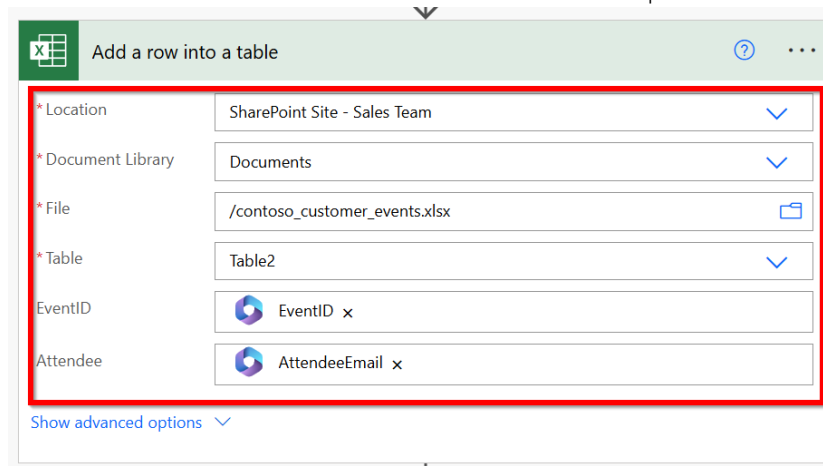

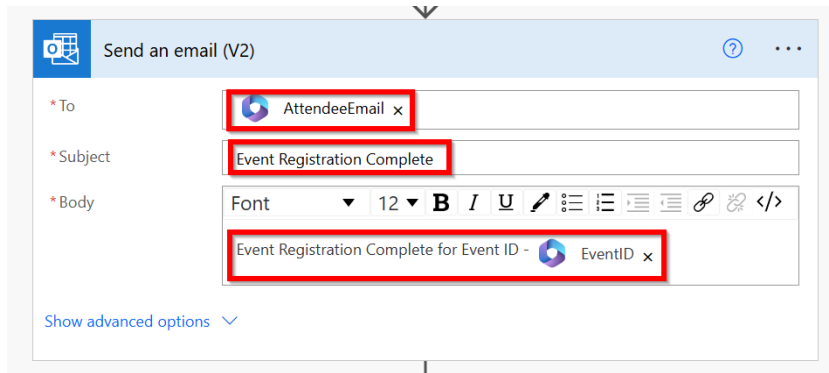

- b. It will take you to the **Flow Designer** page. Switch to the old designer view by clicking on the toggle button on the top right. New designer ☐
- c. Clicking on the first Skill tile. **Add two input variables:** EventID and AttendeeEmail

- d. **Add an excel action** to add a row into a table. Update the fields as follows.

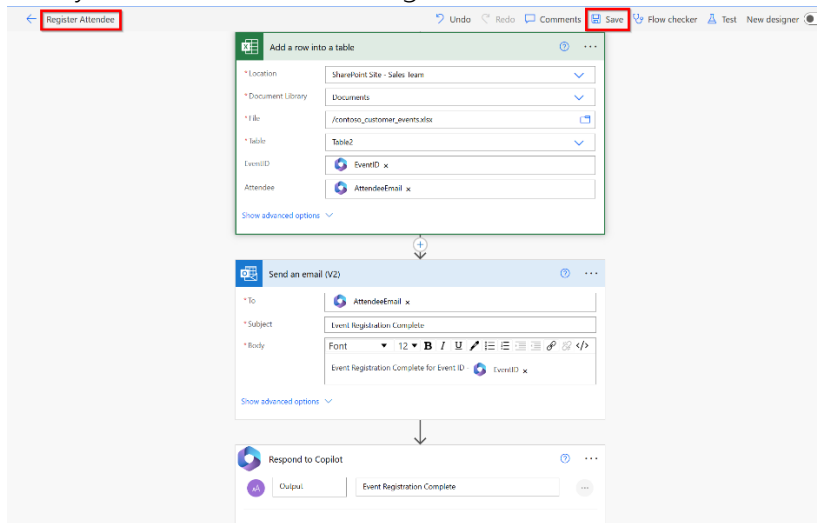

- e. **Add an outlook action** to send emails. Update the fields as follows.

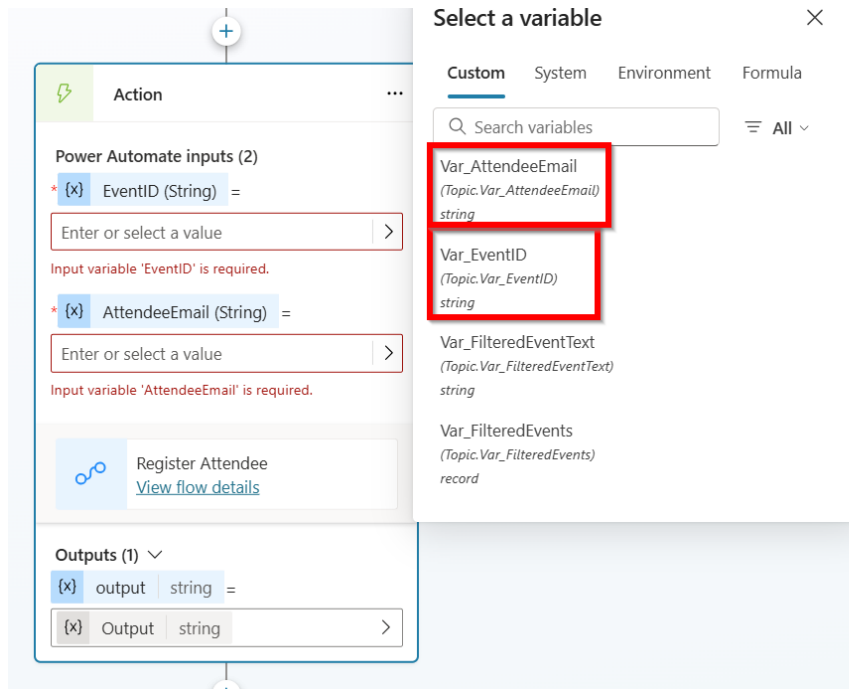

- f. In the respond action, add an output parameter. Set the value to "Event Registration Complete."

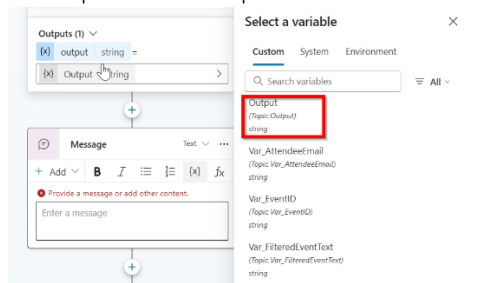

- g. Finally, rename the flow to Register Attendee.

- h. Save the flow in the old designer. Save and Publish if you are using the new designer.
24. Back in copilot studio, map the two input parameters to variables as follows:

25. Add a node to send confirmation message. In the text field, pick the Output variable from previous step.

26. Test the agent. See an example below. You might need to create a connection for the 1st time. Click on Connect and follow the steps.
